

Are You Thinking About an Off-Grid Solar System?

Off-grid solar power is an alternative, renewable energy source that is not tied to the power grid. It is a stand-alone, independent system; you generate your own power for your own needs through solar panels and inverters, with the power stored in batteries, as well as a backup generator for winter months.

Off-grid solar is ideal for:

Remote access or water access properties
Seasonal properties (solar works extremely well spring to fall)
Properties where the cost to bring a hydro line in is very expensive

Is Solar Right For You?

Consider your location:

Where is the hydro line located? How easy is it to tie into the power grid?
Solar systems need sunlight! Trees need to be taken down if the lot is too shady.
Solar is ideal for remote locations such as water access cottages.
How frequent are power outages in your area? You don't experience these when you're off-grid!

Consider lifestyle/values:

Do you care about your energy consumption? Are you energy conscious?
Less impact on the environment as a renewable resource.
Some people choose solar since it has less impact on the environment.
Others appreciate being more self-sufficient and independent, not tied to the grid.

Consider the costs:

Solar power isn't free power!
Solar is beneficial financially if hydro is unavailable or very expensive to put in at your location.
A stand-alone, independent system isn't tied to the power grid so you can't sell back excess power.
Solar systems require regular maintenance. This can be done by you or we can do it for you.
We offer a variety of packages, depending on people's time, skill and interest, so you don't need to worry about it!

We've been living off-grid since 2014 and we've learned a lot! An off-grid system is an excellent power alternative, but it's important to have the proper information to see if it's right for you. We'd be happy to chat with you about it if you're interested!
